In this lecture, you will get an overview of the course project, where you will build a retail pipeline from a retail dataset using different tasks available in Lakeflow jobs.

Course Project Overview

This diagram shows our complete course project architecture. We'll build a retail data processing pipeline that demonstrates all the concepts we're learning.

Starting with retail data in cloud storage, we'll ingest customers, sales, and orders data using different task types. We'll join customers & orders and customers & sales using notebook tasks. The workflow includes an If/Else block for checking duplicates with true and false conditions.

We'll implement a For Each task for state-wise iteration on customer orders data. Finally, we'll create a retail dashboard using a dashboard task.

This project incorporates SQL tasks, notebook tasks, conditional logic, iterative processing, and dashboard creation - giving you hands-on experience with all major Lakeflow Jobs features.
